

GLASS PANEL RAILINGS

IN-FLOOR SYSTEM

The system consists of aluminum supporting brackets which are installed in the base guide profile which is mounted inside the floor. Glass panels of thickness between 16mm-20mm with height maximum 1200mm are fixed with wedge locking system which again can easily be removed in case of a damage to the glasses without damage to the floor or system itself.

The base of the system is covered with aluminum cover profiles in anodized, any RAL color of powder coating or wood imitation.

The 50mm top profile, designed specially for the system comes on top of the glass panels to complete the contemporary look and improve the structural stability of the system.
